Linear Regression - Separate model for each STORE

```
[19]: Y_pred3=np.zeros(test_val.shape[0])
      train_store = train2.groupby(['Store'])
      test_store = test_val2.groupby(['Store'])
      for i in range(1,1116):
          a = train_store.get_group(i)
          b = test_store.get_group(i)
          X_train = a.drop(['Sales','Date','Store','Customers'],axis=1).values
          X val = b.drop(['Sales','Date','Store','Customers'],axis=1).values
          Y train = a['Sales']
          #Y val = b['Sales']
          lr = LinearRegression()
          lr.fit(X train, Y train)
          pred = lr.predict(X_val)
          i=0
          for j in b.index:
              Y_pred3[j]=pred[i]
      print('MSE',np.sqrt(mean_squared_error(Y_pred3,Y_val)))
      print('MAE',mean_absolute_error(Y_pred3,Y_val))
```

```
MSE 2886004774448802.5
MAE 65858982569725.73
```

So from the above 3 models we can conclude that the model perform better with 'Store' as feature. Also the average of all the separate model based on Store Id is the worst model.

Average Ensemble Model of first and second model

```
[23]: final_pred=(Y_pred1+Y_pred2)/2
print('MSE',np.sqrt(mean_squared_error(final_pred,Y_val)))
print('MAE',mean_absolute_error(final_pred,Y_val))

MSE 1786.572723527162
MAE 1295.5365594353661
```

Weighted Average Ensemble Model of first and second model

```
[24]: final_pred=Y_pred1*0.7+Y_pred2*0.3
print('MSE',np.sqrt(mean_squared_error(final_pred,Y_val)))
print('MAE',mean_absolute_error(final_pred,Y_val))
```

```
MSE 1578.2148177872348
MAE 1163.7769636251703
```

Regularization of 1st Model

```
[32]: X_train = train1.drop(['Sales','Date','Customers'],axis=1).values
X_val = test_val1.drop(['Sales','Date','Customers'],axis=1).values
rr =Ridge(alpha=10)
rr.fit(X_train,Y_train)
Y_pred1 = rr.predict(X_val)
print('MSE',np.sqrt(mean_squared_error(Y_pred1,Y_val)))
print('MAE',mean_absolute_error(Y_pred1,Y_val))
print('train model score',rr.score(X_train,Y_train))
print('test model score',rr.score(X_val,Y_val))
```

```
MSE 1431.5196149136414

MAE 1053.9640706528064

train model score 0.8363551306623415

test model score 0.8424313738215597
```

Regualrization technique is not enhancing the performance.

Store 1

```
[4]: store1=Train[Train.Store==1] test_store1=Test_val[Test_val.Store==1]
```

```
[72]: sns.boxplot(x="DayOfWeek", y="Sales", data=store1)
```

[72]: <matplotlib.axes._subplots.AxesSubplot at 0x3d0baab898>

Monday=1, Sunday=7.

Here we can find on Sunday stores are closed. Monday has little larger sales, Thurdays has little smaller. There's a few outliers on all days(except Sunday) but it is less on Weekdays(1,3)

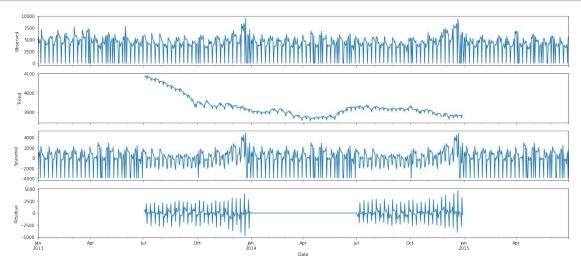

```
[8]: rcParams['figure.figsize'] = 18, 8

decomposition = sm.tsa.seasonal_decompose(store1['Sales'],___

_model='additive',freq=365)

fig = decomposition.plot()

plt.show()
```

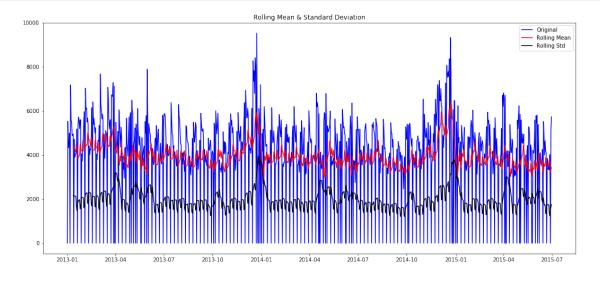

```
[9]: def test_stationarity(timeseries):

#Determing rolling statistics
```

```
rolmean = timeseries.rolling(12).mean()
  rolstd = timeseries.rolling(12).std()
   #Plot rolling statistics:
  orig = plt.plot(timeseries, color='blue',label='Original')
  mean = plt.plot(rolmean, color='red', label='Rolling Mean')
  std = plt.plot(rolstd, color='black', label = 'Rolling Std')
  plt.legend(loc='best')
  plt.title('Rolling Mean & Standard Deviation')
  plt.show(block=False)
   #Perform Dickey-Fuller test:
  print('Results of Dickey-Fuller Test:')
  dftest = adfuller(timeseries, autolag='AIC')
  dfoutput = pd.Series(dftest[0:4], index=['Test Statistic','p-value','#Lags_
→Used','Number of Observations Used'])
  for key,value in dftest[4].items():
       dfoutput['Critical Value (%s)'%key] = value
  print(dfoutput)
```

[10]: test_stationarity(store1['Sales'])

```
Results of Dickey-Fuller Test:

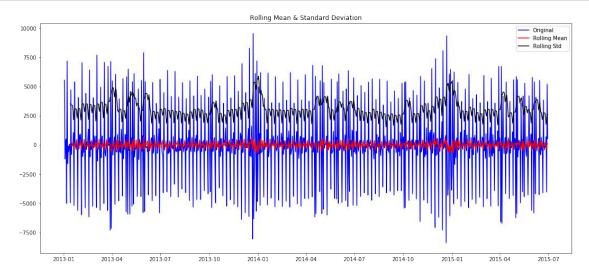

Test Statistic -4.236942
p-value 0.000570
#Lags Used 21.000000
Number of Observations Used 889.000000
Critical Value (1%) -3.437727
```

Critical Value (5%) -2.864797 Critical Value (10%) -2.568504

dtype: float64

The smaller p-value, the more likely it's stationary. Here our p-value is 0.000415. It's actually good, but as we just visually found a little downward trend, we want to be more strict, i.e. if the p value further decreases, this series would be more likely to be stationary. To get a stationary data, there's many techniques. We can use log, differencing etc..

```
[11]: first_diff = store1['Sales'] - store1['Sales'].shift(1)
first_diff = first_diff.dropna(inplace = False)
test_stationarity(first_diff)
```

```
Results of Dickey-Fuller Test:
```

Test Statistic -1.134395e+01
p-value 1.038132e-20
#Lags Used 2.000000e+01
Number of Observations Used 8.890000e+02
Critical Value (1%) -3.437727e+00
Critical Value (5%) -2.864797e+00
Critical Value (10%) -2.568504e+00
dtype: float64

After differencing, the p-value is extremely small. Thus this series is very likely to be stationary.
